

How the whole system works

A practical map for an employee-transport company serving client businesses, including outsourced people and transport resources.

Are all flows working?

The core implemented flows pass the current checks. A fresh API/database run returned 24 test results with zero failures (including group results). This verifies the tested paths; it is not proof that every real-world case or production integration is complete.

Two different kinds of outsourcing

Staffing companies employ passengers. Transport suppliers provide vehicles or drivers. These are separate relationships in the system.

Diagram key

Rounded box: action or state

Diamond: decision/check

Amber box: review or exception

Who receives the service, who employs, who pays

Create these records before planning daily trips. A passenger employer is not automatically the invoice recipient.

From a passenger record to a trip manifest

Owner: administrator or operations manager. Passengers become eligible through a matching active enrollment.

Turn a repeating plan into dated trips

Owner: administrator or operations manager. Use a separate schedule for each direction and shift.

Readiness checks
Contract and resource availability
Valid vehicle/driver documents
Maintenance overlap
Passenger count within seats
Assignment overlap + 20-minute buffer

Default zone: Africa/Cairo. Invalid or ambiguous daylight-saving times are rejected rather than guessed.

Operate the trip and handle exceptions

Owners: operations team or the assigned driver. Resource replacement belongs to the operations team.

Breakdown and fast attendance

Breakdown: pause, replace resources if needed, check capacity/supplier cost, then resume. Original departure and recorded attendance remain.

Fast boarding: record exceptions first; confirm that all remaining passengers are on board. Existing statuses are preserved.

Completion is blocked while any passenger is still Expected. Completed trips cannot be reopened through normal dispatch.

From completed service to a settled balance

Owner: administrator or accountant. Recording a payment is a ledger entry; it does not transfer money through a bank.

Choose where each receipt goes

Accounts belong to the transport company. Client statements track invoices and receipts separately from your cash balances.

Maintenance, expenses, payroll and installments

Maintain operational records without counting the same supplier cost again as payroll or another expense.

MAINTENANCE AND VEHICLE AVAILABILITY

SEPARATE OPERATIONAL FINANCE RECORDS

These records do not form a statutory general ledger and do not automatically disburse payroll or installment payments.

Every action depends on the account and scope

Authentication checks the current account. Changing access invalidates existing sessions; suspended accounts are blocked.

Administrator	Manage operations, treasury accounts, adjustments, finance, users and scopes.
Operations manager	Manage transport setup, schedules, dispatch and resources.
Accountant	Prepare/issue finance documents and record payments; read internal operations.
Viewer	Read internal workspace records; cannot change operational data.
Driver	Assigned trips and attendance; no finance access.
Client	Its authorized trips and issued invoices.
Supplier	Its authorized jobs and issued settlements.

Configure first: set the external account scope in Workspace settings before giving the account access.

Keep the history: workflow changes are audited. Historical manifests keep their saved passenger/employer labels.

Understand what each number actually measures

Internal users can compare 7, 30 or 90 days ending today, using Cairo service dates. Chart values come from saved records.

No denominator displays as a dash. Cash movements are not profit. Fictional demo records are included and labelled in the interface.

A walkthrough, the evidence, and what is still missing

Scope: this local checkout on 26 September 2026. Successful tests support a controlled pilot, not an unconditional production guarantee.

Try the complete daily flow

1. Open Home and a trip labelled DEMO.
2. Review its vehicle, driver and 12-passenger list.
3. Start and confirm. Record absences, then confirm the remaining passengers boarded.
4. Complete the trip. Open Billing, choose payer/month and prepare unbilled service.
5. Review and issue the draft; practise recording a demo receipt.
6. Compare reports and inspect the daily data.

Verified in the current release

Fresh run: 24 test results, zero failures; includes grouped test results.

Real database-backed checks cover imports/enrollment, scheduling/capacity, concurrent generation, portal isolation, trip states, breakdowns, documents and maintenance.

Also tested: invoice/settlement rules, monthly snapshots, payments, session revocation, demo seeding, analytics, bulk attendance and treasury routing/transfer integrity.

Browser checks: mobile trip completion, billing filters, reports, help and responsive layouts.

Not implemented / not verified

No live GPS, route optimization, outbound SMS/WhatsApp/email, or offline driver sync.

No executed bank transfers, government e-invoicing, statutory general ledger, credit notes/refunds, or automatic payroll disbursement.

Pricing beyond monthly/per-trip and a versioned supplier-agreement module need implementation.

Public deployment is not verified. The container path was not run on this host. Real tax rules, opening balances and migrated data still need business review.

Before wider rollout: use one client/fleet pilot, check real contract terms, reconcile trips and balances against source records, replace demo access, and validate hosting plus backup/restore. Treasury is EGP-only; customer advances and historical receivable imports are not automatic.

Source of truth: README.md; docs/USER_MANUAL_EN.md; docs/VERIFICATION.md; server/tests/workflows.test.ts; server/src/modules/operations/operations.routes.ts, operations.logic.ts, analytics.ts and treasury.ts.

Local app: localhost:5173 | In-app manual: </guide> | Reports: </reports> | Demo seed: 48 passengers, 8 schedules, 288 trips (fictional).
